

## 8. APPLICATION DATA

### (1) Installation of indoor unit

RFB012A007

- This installation manual illustrates the method of installing an indoor unit.
- For electrical wiring work, please see instructions set out on the backside.
- For outdoor unit installation and refrigerant piping, please refer to page 25.
- A wired remote control unit is supplied separately as an optional part.
- When install the unit, be sure to check whether the selection of installation place, power supply specificities, usage limitation (piping length, height differences between indoor and outdoor units, power supply voltage and etc.) and installation spaces.
- Keep the installation manual together with owner's manual at a place where any user can read it at any time. Moreover if necessary, ask to hand them to a new user.
- For installing qualified personnel, take precautions in respect to themselves by using suitable protective clothing, gloves, etc., and then perform the installation works.
- Please pay attention not to fall down the tools, etc. when installing the unit at the high position.
- If unusual noise can be heard during operation, consult the dealer.
- The meanings of "Marks" used here are shown as follows:

  - Never do it under any
  - Always do it according to the instruction.

- Both mentions the important items to protect your health and safety so strictly depending on circumstances.
- Be sure to confirm no anomaly on the equipment by commissioning after completed installation and explain the operating methods as well as the maintenance methods of this equipment to the user according to the owner's manual.

### SAFETY PRECAUTIONS

- Read the "SAFETY PRECAUTIONS" carefully first of all and strictly follow it during the installation work in order to protect yourself.
- Precautionary items mentioned below are distinguished into two levels.
- WARNING** and **CAUTION**: Wrong installation would cause serious consequences such as injuries or death.
- CAUTION**: Wrong installation might cause serious consequences depending on circumstances.
- Both mentions the important items to protect your health and safety so strictly following by any means.
- Be sure to confirm no anomaly on the equipment by commissioning after completed installation and explain the operating methods as well as the maintenance methods of this equipment to the user according to the owner's manual.

### WARNING

- Do not vent R410A into the atmosphere : R410A is a fluorinated greenhouse gas, covered by the Kyoto Protocol with GWP=1975.
- Do not run the unit with removed panels or protections.
- Touching rotating components, hot surfaces or high voltage parts can cause personal injury due to entrapment, burn or electric shocks.

- Do not perform any change of protective device itself or its setup condition.
- The forced operation by short-circuiting protective device of pressure switch and temperature controller or the use of non specified component can cause fire or burst.

### CAUTION

#### Carry out the electrical work for ground lead with care.

- Do not connect the ground lead to the gas line, lightning conductor or telephone lines ground lead. Incorrect grounding can cause unit faults due to electric shocks due to short-circuiting.

- Use the circuit breaker of correct capacity. Circuit breaker should be the one that disconnects all poles under over current.

- Using the incorrect one could cause the system failure and fire.
- Install isolator or disconnect switch on the power supply wiring in accordance with the local codes and regulations.

- The isolator should be located in OFF state in accordance with EN60204-1.
- Be sure to install indoor unit properly according to the installation manual in order to run off the drainage smoothly.

- Improper installation of indoor unit can cause dropping water into the room and damaging personal property.
- Install the drainage pipe to run off drainage securely according to the installation manual.

- Incorrect installation of the drainage pipe can cause dropping water into the room and damaging personal property.
- Be sure to install the drainage pipe with descending slope of 1/100 or more, and not to make traps and air-bleeding.

- Check if the drainage runs off securely during commissioning and ensure the space for inspection and maintenance.
- Secure a specimen for installation, inspection and maintenance specified in the manual.

- Insufficient space can result in accident such as personal injury due to the locations listed below.

- Do not install the unit in the locations listed below.
- Power supply with insufficient capacity and incorrect function done by improper work can cause electric shocks and fire.

- The electrical installation must be carried out by the qualified electrician in accordance with "the norm for electrical work" and "electrical wiring regulation", and the system must be connected to the dedicated circuit.
- Power supply with insufficient capacity, and incorrect function done by improper work can cause electric shocks and fire.

- Failure to shut off the power before starting electrical work.
- Failure to shut off the power can cause electric shocks, unit failure or incorrect function of equipment.

- Be sure to use the cables conform to safety standard and cable ampacity or power distribution work.
- Unconformable cables can cause electric shock, abnormal heat production or fire.

- This appliance must be connected to main power supply by means of a circuit breaker or switch (fuse:16A) with a contact separation of at least 2mm.
- When plugging this appliance, a plug conforming to the norm IEC60984-1 must be used.

- Use the prescribed cables for electrical connection, tighten the cables securely in terminal block and relieve the cables correctly to prevent overheating the terminal blocks.

- Arrange the wiring in the control box so that it cannot be pushed up further into the box. Install the service panel correctly.

- Incorrect installation may result in overheating and fire.
- Be sure to switch off the power supply in the event of installation, inspection or servicing.

- If the power supply is not shut off, there is a risk of electric shocks, unit failure or personal injury due to the unexpected start of fan.
- Earth leakage breaker must be installed.

- Do not put the drainage pipe directly into drainage channels where poisonous gases such as sulphide gas can occur.

- Poisonous gases will flow into the room through drainage pipe and seriously affect the user's health and safety. This can also cause the corrosion of the indoor unit and a resultant unit failure or refrigerant leak.

- Ensure that no air enters in the refrigerant circuit when the unit is installed and removed.

- If air enters in the refrigerant circuit, the pressure in the refrigerant circuit becomes too high, which can cause burst and personal injury.
- Do not touch any buttons with wet hands.

- It can cause electric shocks.

- Do not touch any refrigerant pipe with your hands when the system is in operation.

- During operation the refrigerant pipes become extremely hot or extremely cold depending on the operating condition, and it can cause burn injury or frost injury.

### WARNING

- Do not vent R410A into the atmosphere : R410A is a fluorinated greenhouse gas, covered by the Kyoto Protocol with GWP=1975.
- Do not run the unit with removed panels or protections.
- Touching rotating components, hot surfaces or high voltage parts can cause personal injury due to entrapment, burn or electric shocks.

### CAUTION

#### Carry out the electrical work for ground lead with care.

- Do not connect the ground lead to the gas line, lightning conductor or telephone lines ground lead. Incorrect grounding can cause unit faults due to electric shocks due to short-circuiting.

- Use the circuit breaker of correct capacity. Circuit breaker should be the one that disconnects all poles under over current.

- Using the incorrect one could cause the system failure and fire.
- Install isolator or disconnect switch on the power supply wiring in accordance with the local codes and regulations.

- The isolator should be located in OFF state in accordance with EN60204-1.
- Be sure to install indoor unit properly according to the installation manual in order to run off the drainage smoothly.

- Improper installation of indoor unit can cause dropping water into the room and damaging personal property.
- Install the drainage pipe to run off drainage securely according to the installation manual.

- Incorrect installation of the drainage pipe can cause dropping water into the room and damaging personal property.
- Be sure to install the drainage pipe with descending slope of 1/100 or more, and not to make traps and air-bleeding.

- Check if the drainage runs off securely during commissioning and ensure the space for inspection and maintenance.
- Secure a specimen for installation, inspection and maintenance specified in the manual.

- Insufficient space can result in accident such as personal injury due to the locations listed below.

- Do not install the unit where water splashes may occur due to register of the wind or the high rise apartment etc.

- Be sure to perform air tightness test by pressurizing with nitrogen gas after completed refrigerant piping work.
- If the density of refrigerant exceeds the limit in the event of refrigerant leakage in the small room, lack of oxygen can occur, which can cause serious accidents.

- Corrosive gas can cause corrosion of heat exchanger, breakage of plastic parts and etc. And combustible gas can cause fire.

- If leaked gases accumulate around the unit, it can cause fire.
- Do not install the unit where corrosive acid (such as sulfuric acid gas etc.) or combustible gas (such as thinner and petroleum gases) accumulates or collect, or where volatile combustible substances are handled.

- Corrosive gas can cause corrosion of heat exchanger, breakage of plastic parts and etc. And combustible gas can cause fire.
- Since the indoor unit is not waterproof, it can cause electric shocks and fire.

- Do not install the unit close to the equipment that generates electromagnetic fields or high frequency harmonics.

- Equipment such as inverters, standby generators, medical high frequency and communication equipments can affect the system, and cause malfunctions or breakdowns. The system can also affect medical equipment and communication equipment, and obstruct its function or cause jamming.

- Do not place any valuable which will be damaged by getting wet under the indoor unit.

- When the relative humidity is higher than 80% or drainage pipe is clogged, condensation or strange water can drip off and it can cause the damage of valuable.

- Do not install the wireless remote control at the direct sunlight.

- It can cause malfunctions or deformation of the wireless remote control.

- Do not use the unit for special purposes such as storing foods, cooling precision instruments and preservation of animals, plants or art.

- Do not use any materials other than a fuse with the correct rating in the location where users are to be used.

- Connecting the circuit with copper-wire or other metal thread can cause unit failure and fire.

- Do not touch any buttons with wet hands.

- It can cause electric shocks.

- Do not touch any refrigerant pipe with your hands when the system is in operation.

- During operation the refrigerant pipes become extremely hot or extremely cold depending on the operating condition, and it can cause burn injury or frost injury.

**BEFORE INSTALLATION**

○ Before installation check that the power supply matches the air conditioner.

**SELECTION OF INSTALLATION LOCATION**

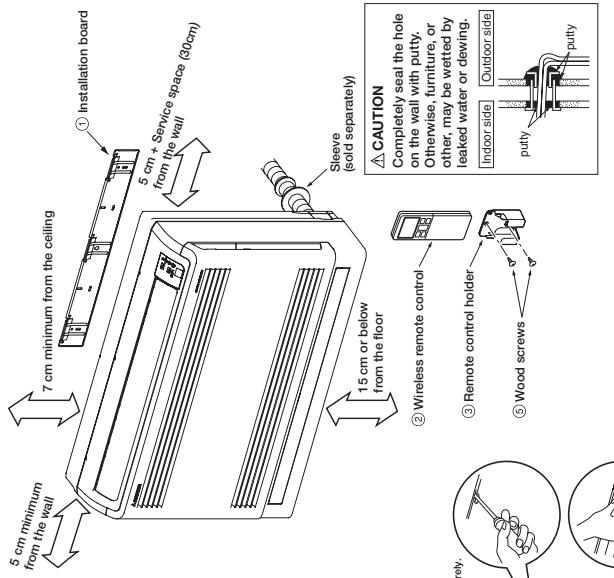

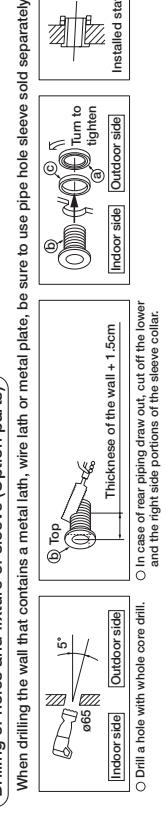

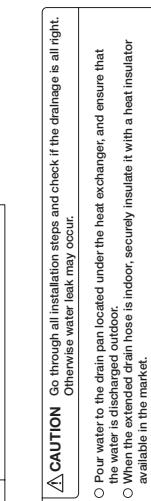

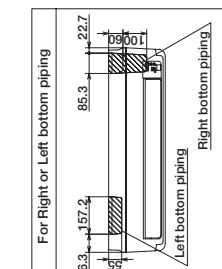

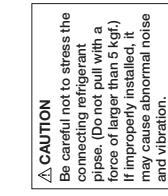

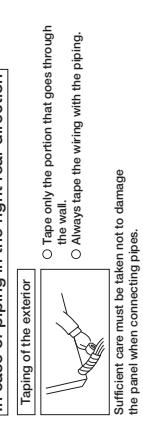

(Initial at location that meets the following conditions, after getting approval from the customer)

**Indoor unit**

- Where there is no obstructions to the air flow and where the cooled and heated air can be evenly distributed.
- A cold place where the unit or the wall will not vibrate.
- A place where there will be enough space for servicing. (Where space mentioned below can be secured)
- Where wiring and the piping will be easy to conduct.
- The place where receiving part is not exposed to the direct rays of the sun or the strong rays of the street lighting.
- A place where it can be easily drained.
- A place separated at least 1m away from the television or the radio. (To prevent interference to images and sounds.)
- Places where this unit is not affected by the high frequency equipment or electric equipment.
- Avoid installing this unit in place where there is much oil mist.
- Places where there is no electric equipment or household under the installing unit.
- Install the indoor unit on flat wall.

**INSTALLATION OF INDOOR UNIT****Wireless remote control**

- A place where the air conditioner can be received the signal surely during operating the wireless remote control.
- Places where there is no affected by the TV and radio etc.
- Do not place where exposed to direct sunlight or near heat devices such as a stove.

**Drilling of holes and fixture of sleeve (Option parts)****Installing the support of piping****OPTIONAL ACCESSORIES**

○ Before installation check that the power supply matches the air conditioner.

**Standard accessories (Installation kit)**

Accessories for indoor unit	Qty
Installation board (Attached to the rear of the indoor unit)	1
Wireless remote control	1
Remote control holder	1
Taping screws (for installation board 0.4 X 25mm)	9
Wood screws	2
Battery [R03 (AAA, Micro) 1.5V]	2
Air-cleaning filters	2
Filter holders (Attached to the front panel of indoor unit)	2
Pipe cover (200mm)	1
Band	2

Option parts	Qty
Sealing plate	1
Sleeve	1
Inclination plate	1
Putty	1
Drain hose (extension hose)	1
Piping cover (for insulation of connection piping)	1

**Necessary tools for the installation work**

1 Plus headed driver	For Right or Left piping	For Right or Left bottom piping
2 Knife	Right/Left piping	Right bottom piping
3 Saw	Right rear piping	Right bottom piping
4 Tape measure	Left rear piping	Left bottom piping
5 Hammer	Left rear piping	Left bottom piping
6 Spanner wrench	Downward	Downward
7 Torque wrench (14.0 ~ 61.0 N·m) (1.4 ~ 6.1 kgf·m)	Rear	Rear
8 Hole core drill (65mm in diameter)	Left rear	Left rear
9 Wrench key (Hexagon) (4mm/m)	Wavy	Wavy
10 Flaring tool set (Designed specifically for R410A)	The drain hose tip is in water	The drain hose tip is in the gutter
11 Gas leak detector (Designed specifically for R410A)	Higher than specified	The gap to the ground is 5 cm or less
12 Gauge for projection adjustment (Used when flare is made by using conventional flare tool)	Odor from the gutter	Go through all installation steps and check if the drainage is all right. Otherwise water leak may occur.
13 Pipe bender		Pour water to the drain pan located under the heat exchanger, and ensure that the water is discharged outdoor. When the extended drain hose is indoor, securely insulate it with a heat insulator available in the market.

**Fixing of indoor unit**

△CAUTION • During the installation, do not lean on the control box or the display, as they may be damaged.

• Install the indoor unit on flat wall. If improperly installed, it may cause abnormal noise and vibration. (Distortion on the wall shall be no larger than 3 mm.)

**Floor installation**

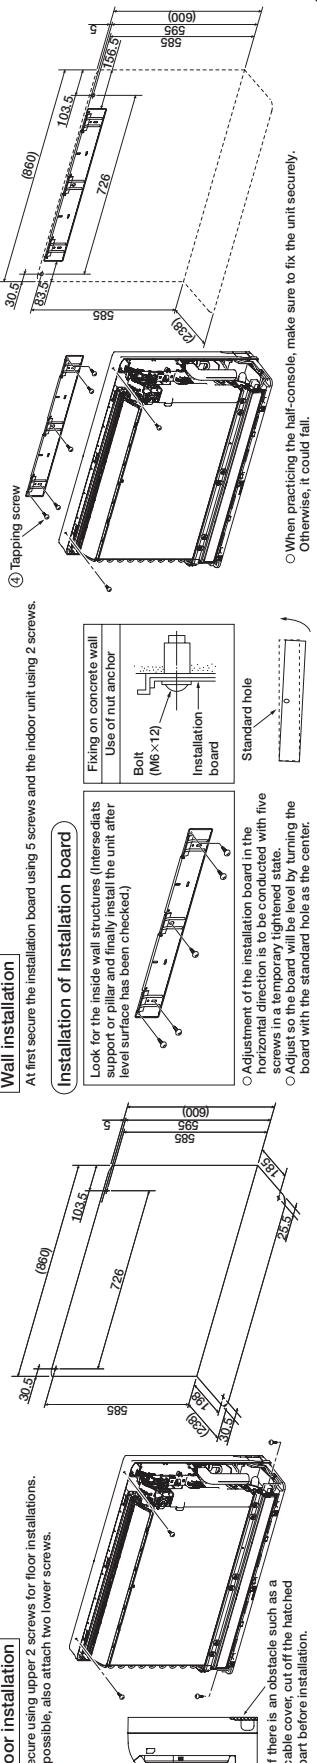

Secure using upper 2 screws for floor installations.  
If possible, also attach two lower screws.

**Wall installation**

At first secure the installation board using 5 screws and the indoor unit using 2 screws.

**Installation of Installation board**

Look for the inside wall structures. (Interspacers support or pillar, and finally install the unit after level surface has been checked.)

## CONNECTION OF REFRIGERANT PIPINGS

**Preparation** Keep the openings of the pipes covered with tapes etc.  
to prevent dust, sand, etc. from entering them.

**Indoor** (Do not turn)

**Copper pipe** (Do not turn)  
Dimension A (mm)  
Liquid side 65.38 : 9.1  
Gas side 69.52 : 13.2  
ø12.7 : 16.6

**Measurement B** (mm)  
Copper pipe diameter  
ø6.35 0.0 - 0.5 1.0 - 1.5 1.5 - 2.0  
ø9.52 0.0 - 0.5 1.0 - 1.5 1.5 - 2.0  
ø12.7 0.0 - 0.5 1.0 - 1.5 2.0 - 2.5

Flaring block

Copper pipe

Copper pipe diameter	Measurement B (mm)		
	Conventional type flare tool for R410A	Clutch type flare tool for R410A	Wing nut type
ø6.35	0.0 - 0.5	1.0 - 1.5	1.5 - 2.0
ø9.52	0.0 - 0.5	1.0 - 1.5	1.5 - 2.0
ø12.7	0.0 - 0.5	1.0 - 1.5	2.0 - 2.5

Use a flare tool that measurement B (protrusion from the flaring block) will vary depending on the type of a flare tool in use.  
If a conventional flare tool is used, please use a copper pipe gauge or a similar instrument to check protrusion so that you can keep measurement B to a correct value.

**Flaring work**

**Do not apply refrigerating machine oil to the flared surface.**

△CAUTION Be careful not to stress the connecting refrigerant pipes. (Do not pull with a force of larger than 5 kgf.)

**Connection**

**Indoor** (Do not turn)

Liquid side  
Gas side

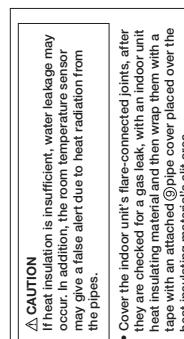

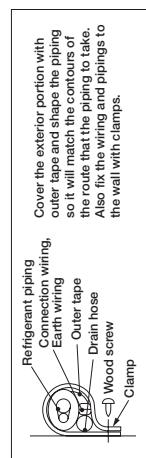

○ Connect the pipes on both liquid and gas sides.  
○ Tighten the nuts to the following torque.  
Liquid side 65.38 : 14.0 - 18.0 N·m (1.4 - 1.8 kgf·m)  
Gas side 69.52 : 34.0 - 42.0 N·m (3.4 - 4.2 kgf·m)  
ø12.7 : 48.0 - 61.0 N·m (4.9 - 6.1 kgf·m)

**Insulation of the connection portion**

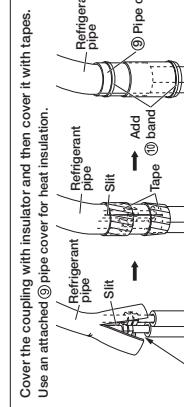

○ Install the removed flared nuts to the pipes to be connected, then flared the pipes.

**Finishing work and fixing**

○ When practicing the half-console, make sure to fix the unit securely.  
Otherwise, it could fall.

△CAUTION Cover the exterior portion with outer tape and shape the piping so it will match the contours of the route that the piping take. Also fix the wiring and pipings to the wall with clamps.

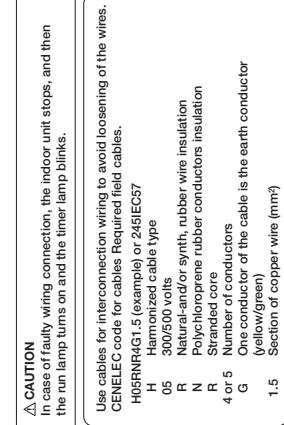

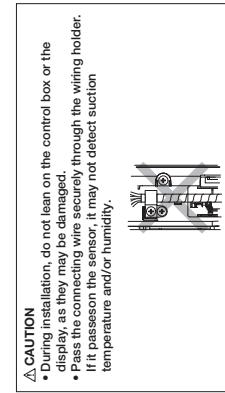

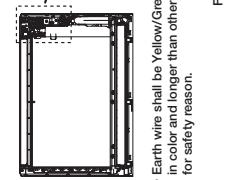

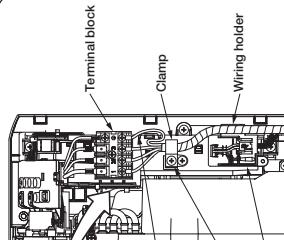

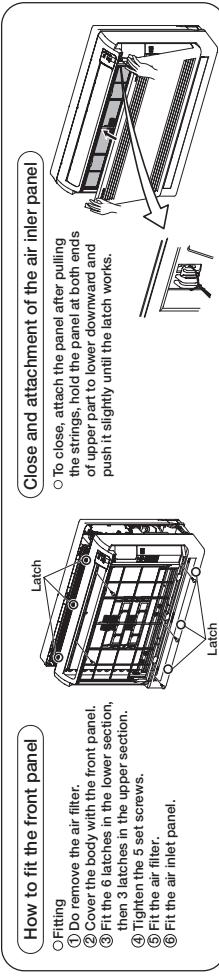

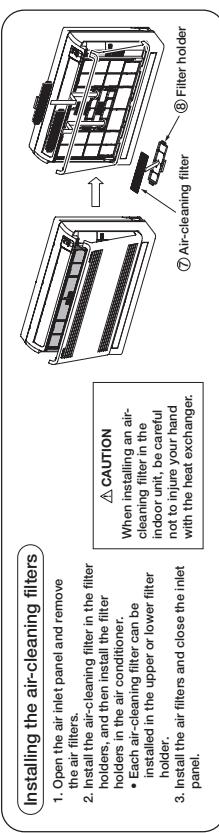

△CAUTION Do not apply excess torque to the flared nuts. Otherwise, the flared nuts may check depending.

## ELECTRICAL WIRING WORK

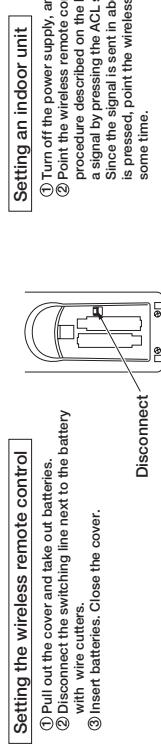

**Preparation of indoor unit**

**Mounting of connecting wires**

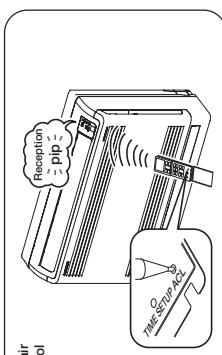

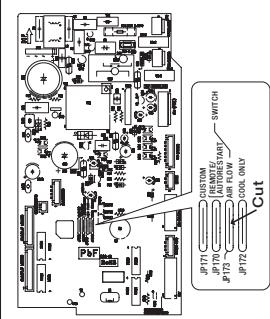

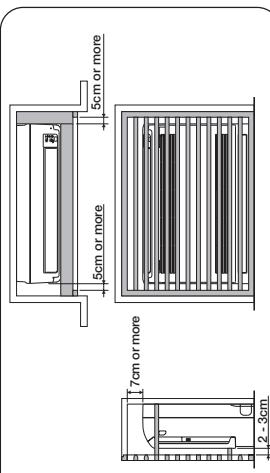

## INSTALLING TWO AIR CONDITIONERS IN THE SAME ROOM

When two air conditioners are installed in the same room, use this setting when the two air conditioners are not operated with one wireless remote control. Set the wireless remote control and indoor unit.

## CONCERNING TERMINAL CONNECTION FOR AN INTERFACE

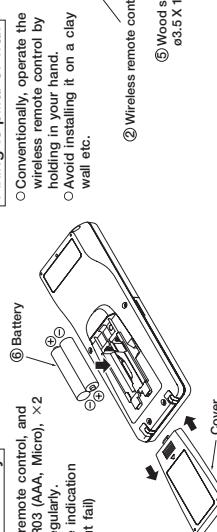

### Concealed installation

Install the indoor unit according to the following instructions.  
 ① Secure the upper, right, and left spaces according to the right figure.  
 ② Do not let the horizontal bar obstruct wind from blowing out upward/downward or reception from this wireless remote control.  
 ③ The lattice size should be 70 % or greater of the open rate.  
 ④ Cut the jumper cable (JP173) on the indoor circuit board to control the blow-out angle.

**CAUTION**  
Incorrect installation may cause problems such as non-cooling, non-warming, and condensation water leaking into the room.

## INSTALLATION OF WIRELESS REMOTE CONTROL

### Fixing to pillar or wall

### Mounting method of battery

⑥ Battery  
Uncover the wireless remote control, and mount the batteries (R03 (AAA, Micro), x2 pieces) in the body regularly.  
⑦ Fit the poles with the indication marks, (⊕ & ⊖ without fail)

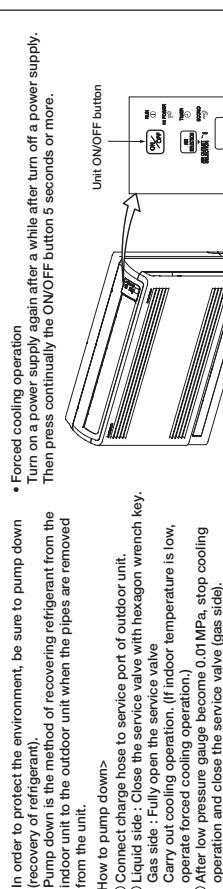

**CAUTION**  
Do not use new and old batteries together.

⑧ Wireless remote control

⑨ Cover

## HOW TO RELOCATE OR DISPOSE OF THE UNIT

## INSTALLATION TEST CHECK POINTS

Check the following points again after completion of the installation, and before turning on the power. Conduct a test run again and ensure that the unit operates properly.

At the same time, explain to the customer how to use the unit and how to take care of the unit following the user's manual.

**Test run**

Service valve is fully open.

□

The pipe joints for indoor and outdoor pipes have been insulated.

□

No abnormal noise.

□

Water drains smoothly.

□

Protective functions are not working.

□

The wireless remote control is normal.

□

Operation of the unit has been explained to the customer. (Three-minutes restart preventive timer)

When the air conditioner is restarted or when changing the operation, the unit will not start operating for approximately 3 minutes. This is to protect the unit and it is not a malfunction.

(2) Installation of outdoor unit  
Models SRC25ZMX-S, 35ZMX-S

- This installation manual deals with outdoor units and general installation specifications only. For indoor units, refer to page 21.
- When install the unit, be sure to check whether the selection of installation place, power supply specifications, usage limitation (piping length, height differences between indoor and outdoor units, power supply voltage and etc.) and installation spaces.

## SAFETY PRECAUTIONS

- Read the "SAFETY PRECAUTIONS" carefully first of all and strictly follow it during the installation work in order to protect yourself.
- The precautionary items mentioned below are distinguished into two levels,  **$\triangle$  WARNING** and  **$\triangle$  CAUTION**.
- $\triangle$  WARNING** : Wrong installation would cause serious consequences such as injuries or death.
- $\triangle$  CAUTION** : Wrong installation might cause serious consequences depending on circumstances.
- Both mentions the important items to protect your health and safety so strictly follow them by any means.
- Be sure to confirm no anomaly on the equipment by commissioning after completed installation and explain the operating methods as well as the maintenance methods of this equipment to the user according to the owners manual.

RWC012A037

Model SRC20-25-35-50  
DXC09-12-18

R410A REFRIGERANT USED

- Keep the installation manual together with owner's manual at a place where any user can read at any time. Moreover, if necessary, ask to hand them to a new user.
- For installing qualified personnel, take precautions in respect to themselves by using suitable protective clothing, gloves, etc., and then perform the installation works.
- Please pay attention not to fall down the tools, etc. when installing the unit at the high position.
- If unusual noise can be heard during operation, consult the dealer.
- The meanings of "Marks" used here are shown as follows:

	Never do it under any circumstances.
	Always do it according to the instruction.

## $\triangle$ WARNING

- Ventilate the working area well in the event of refrigerant leakage during installation.**

If you install the system by yourself, it may cause serious trouble such as water leaks, electric shocks, fire and personal injury as result of a system malfunction. Do not carry out the installation and maintenance work except by the qualified installer.

- Install the system in full accordance with the installation manual.**

Incorrect installation may cause bursts, personal injury, water leaks, electric shocks and fire.

- Be sure to use only for household and residence.**

If this appliance is installed in inferior environment such as machine shop and etc., it can cause malfunction.

- When installing in small rooms, take prevention measures not to exceed the density limit of refrigerant in the event of leakage, referred by the formula (accordance with ISO5449).**

If the density of refrigerant exceeds the limit, please consult the dealer and install the ventilation system, otherwise lack of oxygen can occur, which can cause serious accident.

- Use the original accessories and the specified components for installation.**

If parts other than those prescribed by us are used, it may cause water leaks, electric shocks, fire and personal injury.

- Install the unit in a location with good support.**

Unsuitable installation locations can cause the unit to fall and cause material damage and personal injury.

- Ensure the unit is stable when installed, so that it can withstand earthquakes and strong winds.**

Unsuitable installation locations can cause the unit to fall and cause material damage and personal injury.

- Ensure that no air enters in the refrigerant circuit when the unit is installed and removed.**

If air enters in the refrigerant circuit, the pressure in the refrigerant circuit becomes too high, which can cause burst and personal injury.

- Do not process, splice the power cord, or share a socket with other power plugs.**

This may cause fire or electric shock due to defective contact, defecting insulation and over-current etc.

	• Keep the installation manual together with owner's manual at a place where any user can read at any time. Moreover, if necessary, ask to hand them to a new user.
	• The precautionary items mentioned below are distinguished into two levels, <b><math>\triangle</math> WARNING</b> and <b><math>\triangle</math> CAUTION</b> .  <b><math>\triangle</math> WARNING</b> : Wrong installation would cause serious consequences such as injuries or death.  <b><math>\triangle</math> CAUTION</b> : Wrong installation might cause serious consequences depending on circumstances.
	Both mentions the important items to protect your health and safety so strictly follow them by any means. Both mentions the important items to protect your health and safety so strictly follow them by any means. • The meanings of "Marks" used here are shown as follows:  Never do it under any circumstances. Always do it according to the instruction.
	• Ventilate the working area well in the event of refrigerant leakage during installation. If the refrigerant comes into contact with naked flames, poisonous gas is produced.
	• Use the prescribed pipes, flare nuts and tools for R410A. Using existing parts (for R22 or RA07C) can cause the unit failure and serious accidents due to burst of the refrigerant circuit.
	• Tighten the flare nut by torque wrench with specified method. If the flare nut were tightened with excess torque, this may cause burst and refrigerant leakage after a long period.
	• Do not open the service valves for liquid line and gas line until completed refrigerant piping work, air tightness test and evacuation. If the compressor is operated in state of operation service valves before completed connection of refrigerant piping work, air can be sucked into refrigerant circuit, which can cause burst or personal injury due to anomalously high pressure in the refrigerant.
	• The electrical installation must be carried out by the qualified electrician in accordance with "the norm for electrical work" and "national wiring regulation", and the system must be connected to the dedicated circuit. Power supply with insufficient capacity and incorrect function done by improper work can cause electric shocks and fire.
	• Be sure to shut off the power before starting electrical work. Failure to shut off the power can cause electric shocks, unit failure or incorrect function of equipment.
	• Be sure to use the cables conformed to safety standard and cable ampacity for power distribution work. Unconformable cables can cause electric leak, anomalous heat production or fire.
	• This appliance must be connected to main power supply by means of a Do not bundle, winding or processing for the power cord. Or, do not deform the power plug due to treat it. This may cause fire or heating.
	• Do not run the unit with removed panels or protections. Touching rotating equipments, hot surfaces or high voltage parts can cause personal injury due to entrapment, burn or electric shocks.
	• Do not perform any change of protective device itself or its setup condition. The forced operation by short-circuiting protective device of pressure switch and temperature controller or the use of non specified component can cause fire or burst.

## ⚠ CAUTION

<ul style="list-style-type: none"> <li>• Carry out the electrical work for ground lead with care.</li> </ul> <p>Do not connect the ground lead to the gas line, water line, lighting conductor or telephone line ground lead. Incorrect grounding can cause unit faults such as electric shocks due to short-circuiting.</p>	
!	<ul style="list-style-type: none"> <li>• Use the circuit breaker for all pole correct capacity. Circuit breaker should be the one that disconnects all poles under over current. Using the incorrect circuit breaker, it can cause the unit malfunction and fire.</li> <li>• Install isolator or disconnect switch on the power source wiring in accordance with the local codes and regulations. The isolator should be locked in OFF State in accordance with EN60204-1.</li> <li>• After maintenance, all wiring, wiring test and the like, should be returned to their original state and wiring route, and the necessary clearance from all metal parts should be secured.</li> <li>• Secure a space for installation, inspection and maintenance specified in the manual. Insufficient space can result in accident such as personal injury due to falling from the installation place.</li> </ul>
🚫	<ul style="list-style-type: none"> <li>• Do not install the unit in the locations listed below.           <ul style="list-style-type: none"> <li>• Locations where carbon fiber, metal powder or any powder is floating.</li> <li>• Locations where any substances that can affect the unit such as sulphide gas, chlorine gas, acid and alkaline can occur.</li> <li>• Vehicles and ships.</li> <li>• Locations where cosmetic or special sprays are often used.</li> <li>• Locations with direct exposure of oil mist and steam such as kitchen and machine plant.</li> <li>• Locations where any machines which generate high frequency harmonics are used.</li> <li>• Locations with salty atmospheres such as coastlines.</li> <li>• Locations with heavy snow (if installed be sure to provide base flame and snow hood mentioned in the manual).</li> <li>• Locations where the unit is exposed to chimney smoke.</li> <li>• Locations at high altitude (more than 1000m height).</li> <li>• Locations with ammonia atmospheres.</li> <li>• Locations where heat radiation from other heat source can affect the unit.</li> <li>• Locations without good air circulation.</li> <li>• Locations with any obstacles which can prevent inlet and outlet air of the unit.</li> <li>• Locations where short circuit of air can occur (in case of multiple units installation).</li> <li>• Locations where strong air blows against the air outlet of outdoor unit.</li> <li>• Locations where something located above the unit could fall.</li> </ul> </li> <li>• It can cause remarkable decrease in performance, corrosion and damage of components, malfunction and fire.</li> </ul>
⚠	<ul style="list-style-type: none"> <li>• Use the one that disconnects all poles under over current. Piping, wiring and miscellaneous small parts		④ Sleeve	1	11 (Designed specifically for R410A)
Indoor unit installation manual		⑤ Inclination plate	1	12 Gauge manifold (Designed specifically for R410A)
		⑥ Putty	1	13 Gauge tool set (Designed specifically for R410A)
		⑦ Drain hose (extension hose)	1	14 Flaring tool set (Designed specifically for R410A)
		Piping cover (for insulation of connection piping)	1	15 Gas leak detector (Designed specifically for R410A)
			1	16 Gauge for projection adjustment (Used when flare is made by using conventional flare tool)

### Notabilia as a unit designed for R410A

- Do not use any refrigerant other than R410A. R410A will rise to pressure about 16 times higher than that of a conventional refrigerant.
- A cylinder containing R410A has a pink indication mark on the top.
- A unit designed for R410A has adopted a different size indoor unit service valve charge port and a different size check joint provided in the unit to prevent the charging of a wrong refrigerant by mistake.
- The process dimension of the flared part of a refrigerant pipe and a flare's parallel side measurement must also be altered to raise strength against pressure.
- Accordingly, you are required to arrange dedicated R410A tools listed in the table on the left before installing or servicing this unit.
- Do not use a charge cylinder. The use of a charge cylinder will cause the refrigerant composition to change, which results in performance degradation.
- In charging refrigerant, always take it out from a cylinder in the liquid phase.
- All indoor units must be models designed exclusively for R410A. Check connectable indoor unit models in a catalog, etc. (A wrong indoor unit, if connected into the system, will impair proper system operation)

## 1. HAULAGE AND INSTALLATION

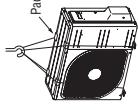

(Take particular care in carrying in or moving the unit, and always perform such an operation with two or more persons.)

### △ CAUTION

When a unit is hoisted with slings or haulage, take into consideration the offset of its gravity center position.  
If not properly balanced, the unit can be thrown off-balance and fall.

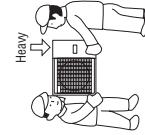

### 1) Delivery

- Deliver the unit as close as possible to the installation site before removing it from the packaging.
- When you have to unpack the unit for a compelling reason, before you haul it to the installation point, hoist the unit with nylon slings or ropes and protection pads so that you may not damage the unit.

### 2) Portage

- The right hand side of the unit (as viewed from the front (diffuser side)) is heavier. A person carrying the right hand side must take heed of this fact. A person carrying the left hand side must hold with his right hand the handle provided on the front panel of the unit and with his left hand the corner column section.

### 3) Selecting the installation location

Be careful of the following conditions and choose an installation place.

- Where air is not trapped.
- Where the installation fittings can be firmly installed.
- Where wind does not hinder the intake and outlet pipes.
- Out of the near range of other heat sources.
- A place where stringent regulation of electric noises is applicable.
- Where it is safe for the drain water to be discharged.
- Where noise and hot air will not bother neighboring residents.
- Where snow will not accumulate.
- Where strong winds will not blow against the outlet pipe.
- A place where no TV set or radio receiver is placed within 1m.  
(If electrical interference is caused, seek a place less likely to cause the problem)
- If a separation is conducted when the outdoor air temperature is -5°C lower, the outdoor unit should be installed at a place where it is not influenced by natural wind.
- Where it is likely that the unit is subjected to strong winds, provide wind guards according to the following guidelines. Strong winds can cause performance degradation, an accidental stop due to a rise of high pressure and a broken fan.

### 4) Caution about selection of installation location

#### (1) If the unit is installed in the area where the snow will accumulate, following measures are required.

The bottom plate of unit and intake, outlet may be blocked by snow.

- 1 Install the unit on the base so that the bottom is higher than snow cover surface.
- 2 Install the unit under or provide the roof on site.

Since drain water generated by defrost control may freeze, following measures are required.  
• Do not execute drain piping work by using a drain elbow and drain grommets (accessories).  
[Refer to Drain piping work.]

### 5) Installation space

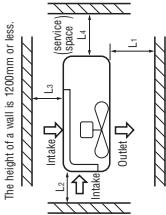

#### (2) If the unit can be affected by strong wind, following measures are required.

- Strong wind can cause damage of fan (fan motor), or can cause performance degradation, or can trigger anomalous stop of the unit due to rising of high pressure.
- When the unit is turned to the wall, install so the direction of the air from the blowing outlet will be perpendicular to the direction of the wind.

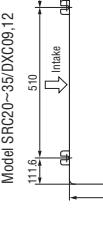

#### (3) Example installation

Model SRC20~50DXC09~18				
Example installation	I	II	III	IV
L1	Open	280	280	180
L2	100	75	80	80
L3	100	80	80	80
L4	250	Open	250	Open

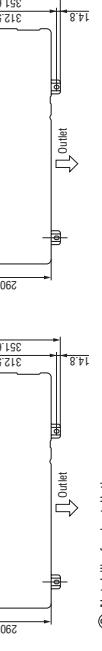

### 6) Installation

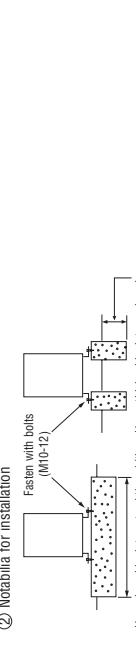

#### ① Anchor bolt fixed position

#### Model SRC20~35DXC09~12

#### Model SRC50DXC18

The height of a wall is 1200mm or less.

- Walls surrounding the unit in the four sides are not acceptable.
- There must be a 1-meter or larger space in the above.
- When more than one unit are installed side by side, provide a 25mm or wider interval between them as a service space. In order to facilitate servicing of controllers, please provide a sufficient space between units so that their top plates can be removed easily.
- Where a danger of short-circuiting exists, install guide louvers.
- When more than one unit are installed, provide sufficient intake space consciously so that short-circuiting may not occur.
- Where piling snow can bury the outdoor unit, provide proper snow guards.

#### ② Notability for installation

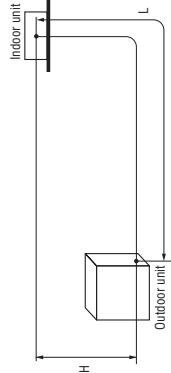

Use a long block to extend the width. Use a thicker block to anchor deeper.

- In installing the unit, fix the unit's legs with bolts specified on the above.
- The protrusion of an anchor bolt on the front side must be kept within 15mm.
- Securely install the unit so that it does not fall over during earthquakes or strong winds, etc.
- Refer to the above illustrations for information regarding concrete foundations.
- Install the unit in a level area. (With a gradient of 5mm or less.) Improper installation can result in a compressor failure, broken piping within the unit and abnormal noise generation.

## 2. REFRIGERANT PIPING WORK

### 1) Restrictions on unit installation and use

- Check the following points in light of the indoor unit specifications and the installation site.
- Observe the following restrictions on unit installation and use. Improper installation can result in a compressor failure or performance degradation.
- Additional refrigerant charge is not required at all (Model SRC20~35/DXG9.12).

**CAUTION** The use restrictions appearing in the table above are applicable to the standard pipe size combinations shown in the table below.

### 2) Determination of pipe size

Determine refrigerant pipe size pursuant to the following guidelines based on the indoor unit specifications.

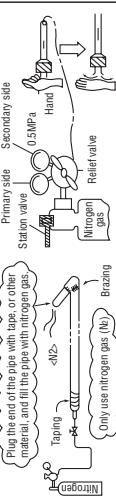

Restrictions	Dimensional restrictions			Marks appearing in the drawing on the right
	Model SRC20~35/DXG9.12	Model SRC30/DXG13		
Main pipe length	15m or less	25m or less	L	
When the outdoor unit is positioned higher,	10m or less	15m or less	H	
When the outdoor unit is positioned lower,	10m or less	15m or less	H	
Elevation difference between indoor and outdoor units				

### When pipe is brazing.

#### About brazing

##### Brazing must be performed under a nitrogen gas flow.

Without nitrogen gas, a large quantity of foreign matters (oxidized film) are created, causing a critical failure from capillary tube or expansion valve clogging.

### 3) Refrigerant pipe wall thickness and material

- Select refrigerant pipes of the table shown on the right wall thickness and material as specified for each pipe size.
- Select pipes having a wall thickness larger than the specified minimum pipe thickness.

#### NOTE

\*Phosphorus deoxidized seamless copper pipe ICS 23.0401.15, ICS 77.150.30

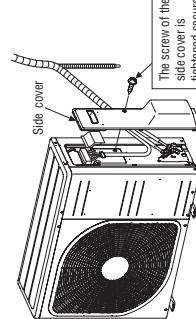

### 4) On-site piping work

**IMPORTANT** Take care so that installed pipes may not touch components within a unit. If touching with an internal component, it will generate abnormal sounds and/or vibrations.

Please remove the screw of a side cover and/or vibrations.  
remove to the front.

**How to remove the side cover**

- Carry out the on site piping work within the service valve fully closed.
- Give sufficient protection to a pipe end (compressed and flared, or with an adhesive tape) so that water or foreign matters may not enter the piping.
- Bend a pipe to a radius as large as practical (R100~R150). Do not bend a pipe repeatedly to correct its form.
- Pipe connection is used between the unit and refrigerant pipe. Flare a pipe after engaging a flare nut onto it. Flare dimensions for R410A are different from those for conventional R407C. Although we recommend the use of flaring tools designed specifically for R410A, conventional flaring tools can also be used by adjusting the measurement of protrusion B with a protrusion control gauge.
- The pipe should be anchored every 1.5m or less to isolate the vibration.
- Tighten a flare joint securely.

**CAUTION** Do not apply force beyond proper fastening torque in tightening the flare nut.

Fix both liquid and gas service valves at the valve main bodies as illustrated on the right, and then fasten them, applying appropriate fastening torque.

Service valve size (mm)	Tightening torque (Nm)	Tightening angle (°)	Recommended length of a tool handle (mm)
ø6.35 (1/4")	14~18	45~60	150
ø9.52 (3/8")	34~42	30~45	200
ø12.7 (1/2")	49~61	30~45	250

## 5) Air tightness test

① Although outdoor and indoor units themselves have been tested for air tightness at the factory, check the connecting pipes after the installation work for air tightness from the service valve's check joint on the outdoor unit side. While conducting a test, keep the service valve shut all the time.

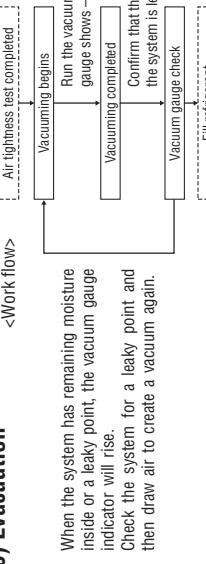

- a) Raise the pressure to 0.5MPa, and then stop. Leave it for five minutes to see if the pressure drops.
- b) Then raise the pressure to 1.5MPa, and stop. Leave it for five more minutes to see if the pressure drops.

c) Then raise the pressure to the specified level (4.15MPa), and record the ambient temperature and the pressure.

- d) If no pressure drop is observed with an installation pressurized to the specified level and left for about one day, it is acceptable. When the ambient temperature fall 1°C, the pressure also fall approximately 0.01MPa. The pressure, if changed, should be compensated for.
- e) If a pressure drop is observed in checking e) and a) – d), a leak exists somewhere. Find a leak by applying bubble test liquid to welded parts and flare joints and repair it. After repair, conduct an air tightness test again.

② In conducting an air tightness test, use nitrogen gas and pressurize the system with nitrogen gas from the gas side. Do not use a medium other than nitrogen gas under any circumstances.

## 6) Evacuation

### Pay attention to the following points in addition to the above for the R410A and compatible machines.

- To prevent a different oil from entering, assign dedicated tools, etc. to each refrigerant type. Under no circumstances must a gauge manifold and a charge hose in particular be shared with other refrigerant types (R22, R407C, etc.).
- Use a counterflow prevention adapter to prevent vacuum pump oil from entering the refrigerant system.

## 7) Additional refrigerant charge (Model SRC50/DXC18)

(1) Calculate a required refrigerant charge volume from the following table.

	Additional charge volume (kg) per meter of refrigerant piping (liquid pipe φ6.35)	Refrigerant volume charged for shipment at the factory (kg)	Installation's pipe length (m) covered without additional refrigerant charge
Model SRC50/DXC18	0.02	1.35	15

- This unit contains factory charged refrigerant covering 15m of refrigerant piping and additional refrigerant charge on the installation site is not required for an installation with up to 15m refrigerant piping. When refrigerant piping exceeds 15m, additionally charge an amount calculated from the pipe length and the above table for the portion in excess of 15m.

Formula to calculate the volume of additional refrigerant required

$$\text{Additional charge volume (kg)} = (\text{Main length (m)} - \text{Factory charged volume } 15 \text{ (m)}) \times 0.02 \text{ (kg/m)}$$

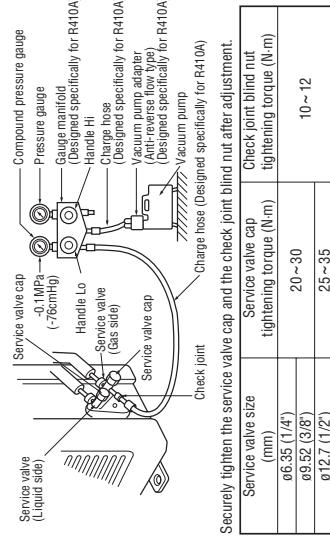

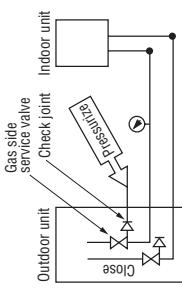

\* When an additional charge volume calculation result is negative, it is not necessary to charge refrigerant additionally.

- For an installation measuring 15m or shorter in pipe length, please charge the refrigerant volume charged for shipment at the factory, when you recharge refrigerant after servicing etc.

## 8) Heating and condensation prevention

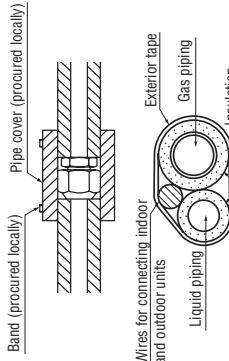

- ① Dress refrigerant pipes (both gas and liquid pipes) for heat insulation and prevention of dew condensation.
- ② Use a heat insulating material that can withstand 120°C or a higher temperature. Poor heat insulating capacity can cause heat insulation problems or cable deterioration.

- All gas pipes must be securely heat insulated in order to prevent damage from dripping water that comes from the condensation formed on them during a cooling operation or personal injury from burns because their surface can reach quite a high temperature due to discharged gas flowing inside during a heating operation.
- Wrap indoor units' flare joints with heat insulating parts (pipe cover) for heat insulation (both gas and liquid pipes).
- Give heat insulation to both gas and liquid side pipes. Bundle a pipe heat insulating material and a pipe tightly together so that no gaps may be left between them and wrap them together with a connecting cable by a dressing tape.
- **Both gas and liquid pipes need to be dressed with 20mm or thicker heat insulation materials above the ceiling where relative humidity exceeds 70%.**

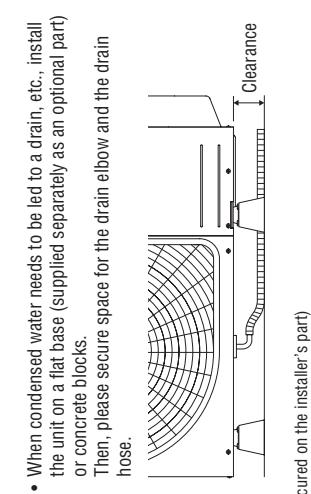

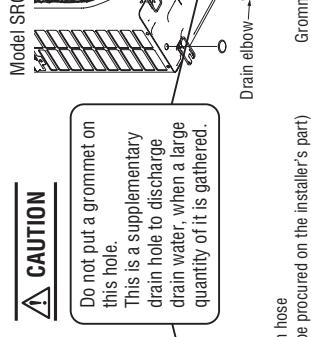

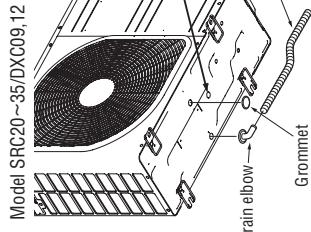

Securely tighten the service valve cap and the check joint blind not after adjustment.

Service valve size (mm)	Service valve cap tightening torque (N·m)	Check joint blind nut tightening torque (N·m)
ø6.35 (1/4")	20~30	10~12
ø9.52 (3/8")		
ø12.7 (1/2")	25~35	

### 3. DRAIN PIPING WORK

- Execute drain piping by using a drain elbow and drain grommets supplied separately as accessories, where water drained from the outdoor unit is a problem.
- Water may drip where there is a larger amount of drain water. Seal around the drain elbow and drain grommets with putty or adequate caulking material.
- Condensed water may flow out from vicinity of service valve or connected pipes.
- Where you are likely to have several days of sub-zero temperatures in a row, do not use a drain elbow and drain grommets. (There is a risk of drain water freezing inside and blocking the drain.)

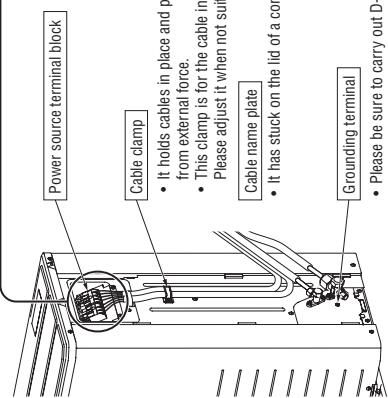

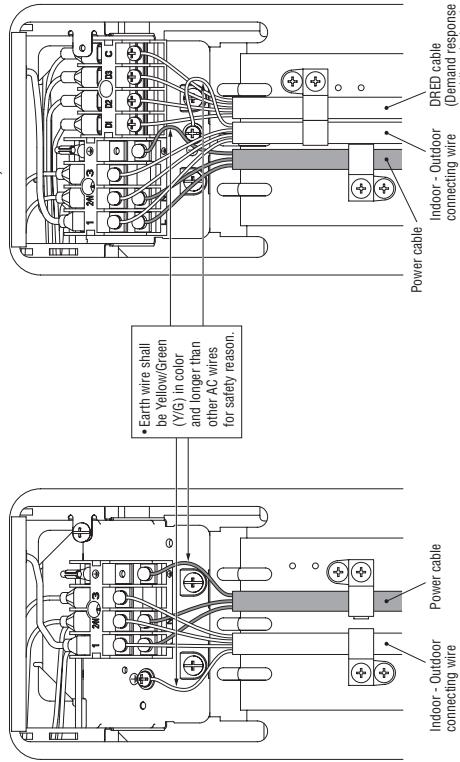

### 4. ELECTRICAL WIRING WORK

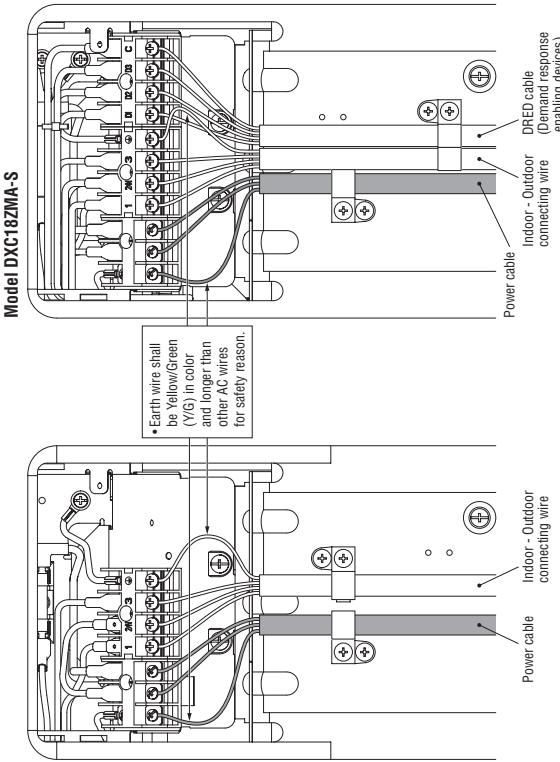

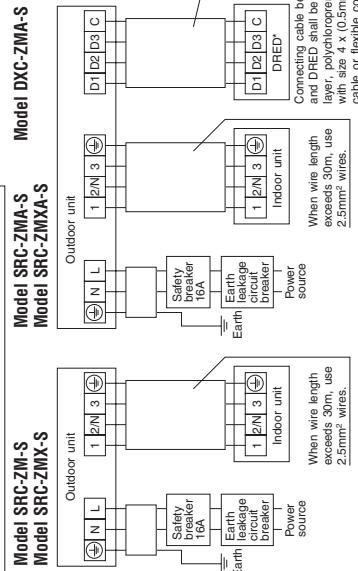

For details of electrical cabling, refer to the indoor unit installation manual.

Electrical installation work must be performed by an electrical installation service provider qualified by a power provider of the country. Electrical installation work must be executed according to the technical standards and other regulations applicable to electrical installations in the country. Electrical installation work must be executed by one specified in parentheses for each type below.

- Do not use any supply cord lighter than one specified in parentheses for each type below.
  - braided cord (code designation 60245 IEC 51)
  - ordinary tough rubber sheathed cord (code designation 60245 IEC 53)
  - flat twin tinsel cord (code designation 60227 IEC 41)
- Use polychloroprene sheathed flexible cord (code designation 60245 IEC57) for supply cords of parts of appliances for outdoor use.
- Ground the unit. Do not connect the grounding wire to a gas pipe, water pipe, lightning rod or telephone grounding wire. If improperly grounded, an electric shock or malfunction may result.
- A grounding wire must be connected before connecting the power cable. Provide a grounding wire longer than the power cable. The installation of an impulse withstand type earth leakage breaker is necessary. A failure to install an earth leakage breaker can result in an accident such as an electric shock or a fire.
- Do not turn on the power until the electrical work is completed.
- Do not use a condensate capacitor for power factor improvement under any circumstances. (It does not improve power factor, while it can cause an abnormal overheat accident)
- For power supply cables, use conduits.
- Do not lay electronic control cables (wireless remote control and signalling wires) and other cables together outside the unit. Laying them together can result in the malfunctioning or a failure of the unit due to electric noises.
- Fasten cables so that may not touch the piping, etc.
- When cables are connected, make sure that all electrical components within the electrical component box are free of loose connector coupling or terminal connection and then attach the cover securely. (Improper cover attachment can result in malfunctioning or a failure of the unit, if water penetrates into the box.)
- Never use a shield cable.
- SRC-ZMA-S, SRC-ZNVA-S and DXC-ZMAs complies with the DRED (Demand Response Enabling Devices) standard AS/NZS4755.3.1 and supports demand response modes 1, 2, and 3 (DRM1, 2, and 3). Since the air conditioner limits the electric power or energy by receiving the DRED input signal, the sense of cooling operation or heating operation may deteriorate over time. The outdoor unit of this air conditioner is equipped with a terminal block for DRED input and supports ELV (Extra-Low Voltage) complying with AS/NZS6335.1.

**Power cable, indoor - outdoor connecting wire circuit diagram**Model SRC20~35ZM-S  
Model SRC20~35ZMX-SModel SRC20~35ZM-S  
Model SRC20~35ZMX-S  
Model DXC09, 12ZM-S

Model SRC50ZM-S

**Power cable, indoor-outdoor connecting wires**Model SRC-ZM-S  
Model SRC-ZNX-S  
Model SRC-ZMVA-S  
Model SRC-ZNVA-S

- Always perform grounding System installation work with the power cord unplugged.

- Connect a pair bearing a common terminal number with an indoor-outdoor connecting wire.
- In cabling, fasten cables securely with cable clamps so that no external force may work on terminal connections.
- Grounding terminals are provided in the control box.

**CAUTION**  
Always use an earth leakage circuit breaker designed for inverter circuits to prevent a faulty operation.

Phase	Earth leakage breaker	Switchgear or Circuit Breaker	Over current protector rated capacity	Power source (minimum)	Interconnecting and grounding wires (minimum)
Single-phase	15A, 30mA, 0.1sec or less	30A	16A	2.0mm <sup>2</sup>	1.5mm <sup>2</sup> X 4

- The specifications shown in the above table are for units without heaters. For units with heaters, refer to the installation instructions or the construction instructions of the indoor unit.
- Switchgear or Circuit breaker capacity which is calculated from MAX. over current should be chosen along the regulations in each country.
- The cable specifications are based on the assumption that a metal or plastic conduit is used with no more than three cables contained in a conduit and a voltage drop is 2%. For an installation falling outside of these conditions, please follow the internal cabling regulations. Adapt it to the regulation in effect in each country.

- This installation manual deals with outdoor units and general installation specifications only. For indoor units, refer to page 21.
- When install the unit, be sure to check whether the selection of installation place, power supply specifications, usage limitation (piping length, height differences between indoor and outdoor units, power supply voltage and etc.) and installation spaces.

## SAFETY PRECAUTIONS

- Read the "SAFETY PRECAUTIONS" carefully first of all and strictly follow it during the installation work in order to protect yourself.
- The precautionary items mentioned below are distinguished into two levels. ** WARNING** and ** CAUTION**.
- ** WARNING** : Wrong installation would cause serious consequences such as injuries or death.
- ** CAUTION** : Wrong installation might cause serious consequences depending on circumstances.
- Both mentions the important items to protect your health and safety so strictly follow them by any means.
- Be sure to confirm no anomaly on the equipment by commissioning after completed installation and explain the operating methods as well as the maintenance methods of this equipment to the user according to the owners manual.

- Keep the installation manual together with owner's manual at a place where any user can read at any time. Moreover if necessary, ask to hand them to a new user.
- For installing qualified personnel, take precautions in respect to themselves by using suitable protective clothing, gloves, etc., and then perform the installation works.
- Please pay attention not to fall down the tools, etc. when installing the unit at the high position.
- If unusual noise can be heard during operation, consult the dealer.
- The meanings of "Marks" used here are shown as follows:

	Never do it under any circumstances.
	Always do it according to the instruction.

## **WARNING**

- **Ventilate the working area well in the event of refrigerant leakage during installation.**

If the refrigerant comes into contact with naked flames, poisonous gas is produced.
- **Use the prescribed pipes, flare nuts and tools for R410A.**

Using existing parts (for R22 or R407C) can cause the unit failure and serious accidents due to burst of the refrigerant circuit.
- **Tighten the flare nut by torque wrench with specified method.**

If the flare nut were tightened with excess torque, this may cause burst and refrigerant leakage after a long period.
- **Do not open the service valves for liquid line and gas line until completed refrigerant piping work, air tightness test and evacuation.**

If the compressor is operated in state of operation service valves before completed connection of refrigerant piping work, air can be sucked into refrigerant circuit, which can cause bust or personal injury due to abnormally high pressure in the refrigerant.
- **The electrical installation must be carried out by the qualified electrician in accordance with "the norm for electrical work" and "national wiring regulation", and the system must be connected to the dedicated circuit.**

Power supply with insufficient capacity and incorrect function done by improper work can cause electric shocks and fire.
- **Be sure to shut off the power before starting electrical work.**

Failure to shut off the power can cause electric shocks, unit failure or incorrect function of equipment.
- **Be sure to use the cables conformed to safety standard and cable ampacity for power distribution work.**

Unconformable cables can cause electric leak, anomalous heat production or fire.
- **This appliance must be connected to main power supply by means of a circuit breaker or switch (fuse:16A) with a contact separation of at least 3mm.**

Loose connections or cable mountings can cause anomalous heat production or fire.
- **Arrange the wiring in the control box so that it cannot be pushed up further into the box. Install the service panel correctly.**

Incorrect installation may result in overheating and fire.
- **Use the prescribed cables for electrical connection, tighten the cables securely in terminal block and relieve the cables correctly to prevent overloading the terminal blocks.**

Incorrect fixing can cause electric shocks or fire due to intrusion of dust or water.
- **Be sure to fix up the service panels.**

If the power supply is not shut off, there is a risk of electric shocks, unit failure or personal injury due to the unexpected start of fan.
- **Stop the compressor before removing the pipe after shutting the service valve on pump down work.**

If the pipe is removed when the compressor is in operation with the service valve open, air would be mixed in the refrigeration circuit and it could cause explosion and injuries due to abnormal high pressure in the cooling cycle.
- **Do not perform any change of protective device itself or its setup condition.**

The forced operation by short-circuiting protective device of pressure switch and temperature controller or the use of non specified component can cause fire or burst.

## ⚠ CAUTION

<ul style="list-style-type: none"> <li><b>Carry out the electrical work for ground lead with care.</b> Do not connect the ground lead to the gas line, water line, lighting conductor or telephone line's ground lead. Incorrect grounding can cause unit faults such as electric shocks due to short-circuiting.</li> </ul>	<ul style="list-style-type: none"> <li><b>Take care when carrying the unit by hand.</b> If the unit weighs more than 20kg, it must be carried by two or more persons. Do not carry by the plastic straps, always use the carry handle when carrying the unit by hand. Use gloves to minimize the risk of cuts by the aluminum fins.</li> </ul>	<ul style="list-style-type: none"> <li><b>When perform the air conditioner operation (cooling or drying operation) in which ventilation is installed in the room.</b> In this case, using the air conditioner with the unit malfunction and fire. There is the possibility that drain water may backflow with the room lapse into the negative pressure status. Therefore, set up the opening port such as incorporate the air into the room that may appropriate to ventilation (For example; Open the door a little). In addition, just as above, so set up the opening port if the room lapse into negative pressure status due to register of the wind for the high rise apartment etc.</li> </ul>
<ul style="list-style-type: none"> <li><b>Use the circuit breaker for all pole correct capacity. Circuit breaker should be the one that disconnects all poles under over current.</b> Using the incorrect circuit breaker, it can cause the unit malfunction and fire.</li> </ul>	<ul style="list-style-type: none"> <li><b>Install isolator or disconnect switch on the power source wiring in accordance with the local codes and regulations.</b> The isolator should be locked in OFF state in accordance with EN60204-1.</li> </ul>	<ul style="list-style-type: none"> <li><b>After maintenance, all wiring, wiring ties and the like, should be returned to their original state and wiring route, and the necessary clearance from all metal parts should be secured.</b></li> </ul>
<ul style="list-style-type: none"> <li><b>Secure a space for installation, inspection and maintenance specified in the manual.</b> Insufficient space can result in accident such as personal injury due to falling from the installation place.</li> </ul>	<ul style="list-style-type: none"> <li><b>Do not install the unit in the locations listed below.</b> <ul style="list-style-type: none"> <li>Locations where carbon fiber, metal powder or any powder is floating.</li> <li>Locations where substances that can affect the unit such as sulphide gas, chloride gas, acid and alkaline can occur.</li> <li>Vehicles and ships.</li> <li>Locations where cosmetic or special sprays are often used.</li> <li>Locations with direct exposure of oil mist and steam such as kitchen and machine plant.</li> <li>Locations where any machines which generate high frequency harmonics are used.</li> <li>Locations with salty atmospheres such as coastlines.</li> <li>Locations with heavy snow (if installed, be sure to provide base frame and snow hood mentioned in the manual).</li> <li>Locations where the unit is exposed to chimney smoke.</li> <li>Locations at high altitude (more than 1000m high).</li> <li>Locations where heat radiation from other heat source can affect the unit.</li> <li>Locations without good air circulation.</li> <li>Locations with any obstacles which can prevent inlet and outlet air of the unit.</li> <li>Locations where short circuit of air can occur (in case of multiple units installation).</li> <li>Locations where strong air blows against the air outlet of outdoor unit.</li> <li>Locations where something located above the unit could fall.</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li><b>Do not install the outdoor unit in the locations listed below.</b> <ul style="list-style-type: none"> <li>Locations where discharged hot air or operating sound of the outdoor unit can blow to the neighborhood.</li> <li>Locations where outlet air of the outdoor unit blows directly to an animal or plants. The outlet air can affect adversely to the plant etc.</li> <li>Locations where vibration can be amplified and transmitted due to insufficient strength of structure.</li> <li>Locations where vibration and operation sound generated by the outdoor unit can affect seriously (on the wall or at the place near heat room).</li> <li>Locations where an equipment affected by high harmonics is placed (TV set or radio receiver is placed within 5m).</li> <li>Locations where drainage cannot run off safely.</li> <li>It can affect surrounding environment and cause a claim.</li> </ul> </li> </ul>
<ul style="list-style-type: none"> <li><b>Do not install the unit near the location where leakage of combustible gases can occur.</b> If leaked gases accumulate around the unit it can cause fire.</li> </ul>	<ul style="list-style-type: none"> <li><b>Do not install the unit where corrosive gas (such as sulfurous acid gas etc.) or combustible gas (such as thinner and petroleum gases) can accumulate or collect, or where volatile combustible substances are handled.</b> Corrosive gas can cause corrosion of heat exchanger, breakage of plastic parts and etc. And combustible gas can cause fire.</li> </ul>	<ul style="list-style-type: none"> <li><b>Do not touch any refrigerant pipes with your hands when the system is in operation.</b> During operation the refrigerant pipes become extremely hot or extremely cold depending the operating condition, and it can cause burn injury or frost injury.</li> <li><b>Do not touch the suction or aluminum fin on the outdoor unit.</b> This may cause injury.</li> <li><b>Do not put anything on the outdoor unit and operating unit.</b> This may cause damage the objects or injury due to falling to the object.</li> <li><b>Do not use the unit for special purposes such as storing foods, cooling precision instruments and preservation of animals, plants or art.</b></li> <li><b>Do not clean up the unit with water.</b></li> </ul>

<b>Necessary tools for the installation work</b>	
1 Plus headed driver	9 Wrench key (Hexagon) (4mm)
2 Knife	10 Vacuum pump
3 Saw	11 Vacuum pump adapter (Anti-reverse flow type)
4 Tape measure	12 Gauge manifold (Designed specifically for R410A)
5 Hammer	13 Charge hose (Designed specifically for R410A)
6 Spanner wrench	14 Flaring tool set (Designed specifically for R410A)
7 Torque wrench (14.0 ~ 62.0Nm) (1.4 ~ 6.2kgf·m)	15 Gas leak detector (Designed specifically for R410A)
8 Hole core drill (65mm in diameter)	16 Gauge for projection adjustment (Used when flare is made by using conventional flare tool)

### Check before installation work

Accessories for outdoor unit	Qty
③ Sealing plate	1
④ Sleeve	1
⑤ Inclination plate	1
⑥ Putty	1
⑦ Drain hose (extension hose)	1
⑧ Piping cover	1
⑨ Grommet (Heat pump type only)	4
⑩ Drain elbow (Heat pump type only)	1

### Notabilia as a unit designed for R410A

- Do not use any refrigerant other than R410A. R410A will rise to pressure about 1.6 times higher than that of a conventional refrigerant.
- A cylinder containing R410A has a pink indication mark on the top.
- A unit designed for R410A has adopted a different size indoor unit service valve charge port and a different size check joint provided in the unit to prevent the charging of a wrong refrigerant by mistake.
- The processed dimension of the flared part of a refrigerant pipe and a flare on its parallel side measurement have also been altered to raise strength against pressure.
- Accordingly, you are required to arrange dedicated R410A tools listed in the table on the left before installing or servicing this unit.
- Do not use a charge cylinder. The use of a charge cylinder will cause the refrigerant composition to change, which results in performance degradation.
- In charging refrigerant, always take it out from a cylinder in the liquid phase.
- All indoor units must be models designed exclusively for R410A. Check connectable indoor unit models in a catalog, etc. (A wrong indoor unit, if connected into the system, will impair proper system operation)

## 1. HAULAGE AND INSTALLATION

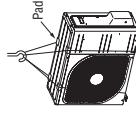

(Take particular care in carrying in or moving the unit, and always perform such an operation with two or more persons.)

### **△ CAUTION**

When a unit is hoisted with slings for haulage, take into consideration the offset of its gravity center position.  
If not properly balanced, the unit can be thrown off-balance and fall.

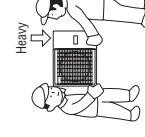

#### 1) Delivery

- Deliver the unit as close as possible to the installation site before removing it from the packaging.
- When you have to unpack the unit for a compelling reason before you haul it to the installation point, hoist the unit with nylon slings or ropes and protection pads so that you may not damage the unit.

#### 2) Portage

- The right hand side of the unit as viewed from the front (diffuser side) is heavier. A person carrying the right hand side must take heed of this fact. A person carrying the left hand side must hold with his right hand the handle provided on the front panel of the unit and with his left hand the corner column section.

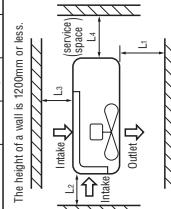

#### 3) Selecting the installation location

Be sure to select a suitable installation place in consideration of following conditions.

- A place where it is horizontal, stable and can endure the unit weight and will not allow vibration transmittance of the unit.
- A place where it can be free from possibility of bothering neighbors due to noise or exhaust air from the unit.
- A place where the unit is not exposed to oil splashes.
- A place where it can be free from danger of flammable gas leakage.
- A place where train water can be disposed without any trouble.
- A place where the unit will not be affected by heat radiation from other heat source.
- A place where snow will not accumulate.
- A place where the unit can be kept away 5m or more from TV set and/or radio receiver in order to avoid any radio or TV interference.
- A place where good air circulation can be secured, and enough service space can be secured for maintenance and service of the unit safely.
- A place where the unit will not be affected by electromagnetic waves and/or high-harmonic waves generated by other equipment.
- A place where chemical substances like sulfuric gas, chloric gas, acid and alkali (including ammonia), which can harm the unit, will not be generated and not remain.
- If a operation is conducted when the outdoor air temperature is -5 lower, the outdoor unit should be installed at a place where it is not influenced by natural wind.
- A place where strong wind will not blow against the outlet air blow of the unit.

#### 5) Installation space

Size	Model 40, 50, 60 (mm)			
	I	II	III	IV
L1	Open	280	280	180
L2	100	75	Open	80
L3	100	80	80	80
L4	250	Open	250	Open

#### 6) Installation

##### ① Anchor bolt fixed position

- Install the unit on the base so that the bottom is higher than snow cover surface.
- Fasten with bolts (M10-12).
- Use a long block to extend the width. Use a thicker block to anchor deeper.
- In installing the unit, fix the unit's legs with bolts specified on the above.
- The protrusion of an anchor bolt on the front side must be kept within 15mm.
- Securely install the unit so that it does not fall over during earthquakes or strong winds, etc.
- Refer to the above illustrations for information regarding concrete foundations.
- Install the unit in a level area. (With a gradient of 0mm or less.) Improper installation can result in a compressor failure, broken piping within the unit and abnormal noise generation.

#### 4) Caution about selection of installation location

- If the unit is installed in the area where the snow will accumulate, following measures are required.
  - The bottom plate of unit and intake, outlet may be blocked by snow.

- Install the unit under or provide the roof on site.
- Use a long block to extend the width. Use a thicker block to anchor deeper.

- Since drain water generated by defrost control may freeze, following measures are required.
- Do not execute drain piping work by using a drain elbow and drain grommets (accessories). [Refer to Drain piping work.]

## 2. REFRIGERANT PIPING WORK

### 1) Restrictions on unit installation and use

- Check the following points in light of the indoor unit specifications and the installation site.
- Observe the following restrictions on unit installation and use. Improper installation can result in a compressor failure or performance degradation.

Restrictions		Dimensional restrictions	Marks appearing in the drawing on the right
Main pipe length		30m or less	L
Elevation difference between Indoor and outdoor units	When the outdoor unit is positioned higher. When the outdoor unit is positioned lower.	20m or less 20m or less	H H

#### ⚠ CAUTION

- The use restrictions appearing in the table above are applicable to the standard pipe size combinations shown in the table below.
- Where an existing pipe system is utilized, different one-way pipe length restrictions should apply depending on its pipe size.

### 2) Determination of pipe size

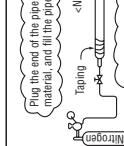

Determine refrigerant pipe size pursuant to the following guidelines based on the indoor unit specifications.

Model 40, 50, 60	
Gas pipe	Liquid pipe
q127	q6.35
Flare	Flare
Outdoor unit connected	
Refrigerant piping (branch pipe L)	q127
Indoor unit connected	q127
	q6.35

#### When pipe is brazing.

##### About brazing

- Brazing must be performed under a nitrogen gas flow.**  
Without nitrogen gas, a large quantity of foreign matters (oxidized film) are created, causing a critical failure from capillary tube or expansion valve clogging.

- Select pipes having a wall thickness larger than the specified minimum pipe thickness.
- Select refrigerant pipes of the table shown on the right wall thickness and material as specified for each pipe size.

#### NOTE

- Select pipes having a wall thickness larger than the specified minimum pipe thickness.
- Select refrigerant pipes of the table shown on the right wall thickness and material as specified for each pipe size.

### 3) Refrigerant pipe wall thickness and material

- Select refrigerant pipes of the table shown on the right wall thickness and material as specified for each pipe size.

#### NOTE

- Select pipes having a wall thickness larger than the specified minimum pipe thickness.

### 4) On-site piping work

- Take care so that installed pipes may not touch components within a unit.
- If touching with an internal component, it will generate abnormal sounds and/or vibrations.

#### ⚠ IMPORTANT

- Please remove the screw of a side cover and remove to the front.

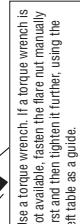

#### How to remove the side cover

- Carry out the on site piping work with the service valve fully closed.
- Give sufficient protection to a pipe end (compressed and flared, or with an adhesive tape) so that water or foreign matters may not enter the piping.
- Bend a pipe to a radius as large as practical (R100 ~ R150). Do not bend a pipe repeatedly to correct its form.
- Pipe connection is used between the unit and refrigerant pipe. Flare a pipe after engaging a flare nut onto the pipe end.
- Flare dimensions for RA10A are different from those for conventional RA07C. Although we recommend the use of flaring tools designed specifically for RA10A, conventional flaring tools can also be used by adjusting the measurement of protrusion B with a precision control gauge.
- The pipe should be anchored every 1.5m or less to isolate the vibration.
- Tighten a flare joint securely with a double spanner.

#### ⚠ CAUTION Do not apply force beyond proper fastening torque in tightening the flare nut.

- Fix both liquid and gas service valves at the valve main bodies as illustrated on the right, and then fasten them, applying appropriate fastening torque.

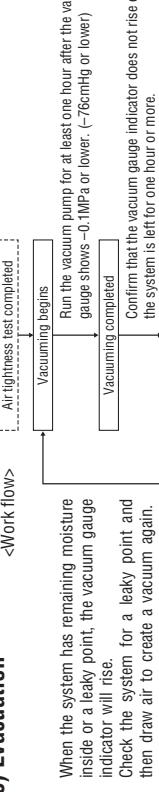

Service valve size (mm)	Tightening torque (N·m)	Tightening angle (°)	Recommended length of a tool handle (mm)
q6.35 (1/4")	14~18	45~60	150
q12.7 (1/2")	49~61	30~45	250

## 5) Air tightness test

- ① Although outdoor and indoor units themselves have been tested for air tightness at the factory, check the connecting pipes after the installation work for air tightness, from the service valve's check joint equipped on the outdoor unit side. While conducting a test, keep the service valve shut all the time.
- Raise the pressure to 0.5MPa, and then stop. Leave it for five minutes to see if the pressure drops.
  - Then raise the pressure to 1.5MPa, and stop. Leave it for five more minutes to see if the pressure drops.
  - Then raise the pressure to the specified level (4.15MPa), and record the ambient temperature and the pressure.
  - If no pressure drop is observed with an installation pressurized to the specified level and left for about one day, it is acceptable. When the ambient temperature fall 1°C, the pressure also fall approximately 0.01MPa. The pressure, if changed, should be compensated for.
  - If a pressure drop is observed in checking e) and a) - d), a leak exists somewhere. Find a leak by applying a bubble test liquid to welded parts and flare joints and repair it. After repair, conduct an air tightness test again.
- ② In conducting an air tightness test, use nitrogen gas and pressurize the system with nitrogen gas from the gas side. Do not use a medium other than nitrogen gas under any circumstances.

## 6) Evacuation

### Pay attention to the following points in addition to the above for the R410A and compatible machines.

- To prevent a different oil from entering, assign dedicated tools, etc. to each refrigerant type. Under no circumstances must a gauge manifold and a charge hose in particular be shared with other refrigerant types (R22, R407C, etc.).
- Use a counterflow prevention adapter to prevent vacuum pump oil from entering the refrigerant system.

## 7) Additional refrigerant charge

- (1) Calculate a required refrigerant charge volume from the following table.

	Additional charge volume (kg) (liquid pipe 0.35)	Refrigerant volume charged for shipment at the factory (kg)	Installation's pipe length (m) covered without additional refrigerant charge
Model 40, 50, 60	0.02	1.50	15

- This unit contains factory charged refrigerant covering 15m of refrigerant piping and additional refrigerant charge on the installation site is not required for an installation with up to 15m refrigerant piping. When refrigerant piping exceeds 15m, additionally charge an amount calculated from the pipe length and the above table for the portion in excess of 15m.
- If an existing pipe system is used, a required refrigerant charge volume will vary depending on the liquid pipe size. For further information, please see "5. UTILIZATION OF EXISTING PIPING."

Formula to calculate the volume of additional refrigerant required

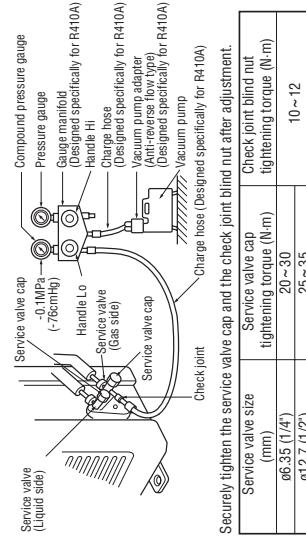

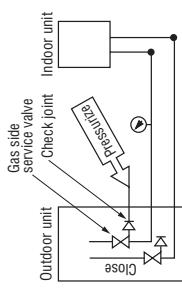

$$\text{Additional charge volume (kg)} = (\text{Main length (m)} - \text{Factory charged volume } 15(\text{m})) \times 0.02(\text{kg/m})$$

- \* When an additional charge volume calculation result is negative, it is not necessary to charge refrigerant additionally.
- For an installation measuring 15m or shorter in pipe length, please charge the refrigerant volume charged for shipment at the factory, when you recharge refrigerant after servicing etc.

## 8) Heating and condensation prevention

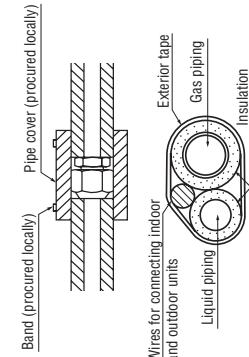

- (1) Dress refrigerant pipes (both gas and liquid pipes) for heat insulation and prevention of dew condensation.

- Improper heat insulation/dew dressing can result in a water leak or dripping causing damage to household effects, etc.
- Use a heat insulating material that can withstand 120°C or a higher temperature. Poor heat insulating capacity can cause heat insulation problems or cable deterioration.
- All gas pipes must be securely heat insulated in order to prevent damage from dripping water that comes from the condensation formed on them during a cooling operation or personal injury from burns because their surface can reach quite a high temperature due to discharged gas flowing inside during a heating operation.
- Wrap indoor units flare joints with heat insulating parts (pipe cover) for heat insulation (both gas and liquid pipes).
- Give heat insulation to both gas and liquid side pipes. Bundle a heat insulating material and a pipe tightly together so that no gaps may be left between them and wrap them together with a connecting cable by a dressing tape.
- Both gas and liquid pipes need to be dressed with 20mm or thicker heat insulation materials above the ceiling where relative humidity exceeds 70%.

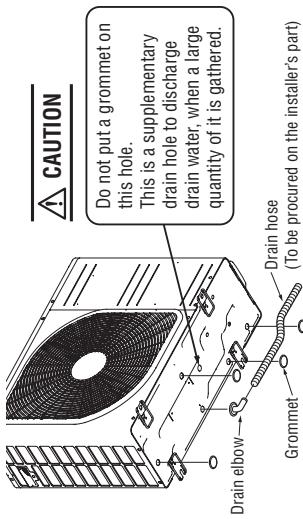

Securely tighten the service valve cap and the check joint blind nut after adjustment.

Service valve size (mm)	Service valve cap tightening torque (Nm)	Check joint blind nut tightening torque (Nm)
66.35 (1/4")	20~30	20~30
61.27 (1/2")	25~35	10~12

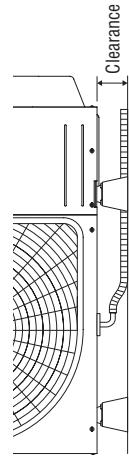

### 3. DRAIN PIPING WORK

- Execute drain piping by using a drain elbow and drain grommets supplied separately as accessories, where water drained from the outdoor unit is a problem.
- Water may drip where there is a larger amount of drain water. Seal around the drain elbow and drain grommets with putty or adequate caulking material.
- Condensed water may flow out from vicinity of service valve or connected pipes.
- Where you are likely to have several days of sub-zero temperatures in a row, do not use a drain elbow and drain grommets. (There is a risk of drain water freezing inside and blocking the drain.)

- When condensed water needs to be led to a drain, etc., install the unit on a flat base (supplied separately as an optional part) or concrete blocks. Then, please secure space for the drain elbow and the drain hose.

### 4. ELECTRICAL WIRING WORK

For details of electrical cabling, refer to the indoor unit installation manual.

Electrical installation work must be performed by an electrical installation service provider, qualified by a power provider of the country. Electrical installation work must be executed according to the technical standards and other regulations applicable to electrical installations in the country.

- Do not lay electronic control cables (wireless remote control and signalling wires) and other cables together outside the unit. Laying them together can result in the malfunctioning or a failure of the unit due to electric noises.
- Fasten cables so that may not touch the piping, etc.
- When cables are connected, make sure that all electrical components within the electrical component box are free of loose connector coupling or terminal connection and then attach the cover securely. (Improper cover attachment can result in malfunctioning or a failure of the unit, if water penetrates into the box.)
- Never use a shield cable.

If improperly grounded, an electric shock or malfunction may result.

- A grounding wire must be connected before connecting the power cable. Provide a grounding wire longer than the power cable.
- The installation of an impulse withstanding type earth leakage breaker is necessary. A failure to install an earth leakage breaker can result in an accident such as an electric shock or a fire.
- Do not turn on the power until the electrical work is completed.
- Do not use a condensive capacitor for power factor improvement under any circumstances. (It does not improve power factor, while it can cause an abnormal overheat accident)
- For power supply cables, use conduits.

**CAUTION**

In case of faulty wiring connection, the indoor unit stops, and then the run lamp turns on and the timer lamp blinks.

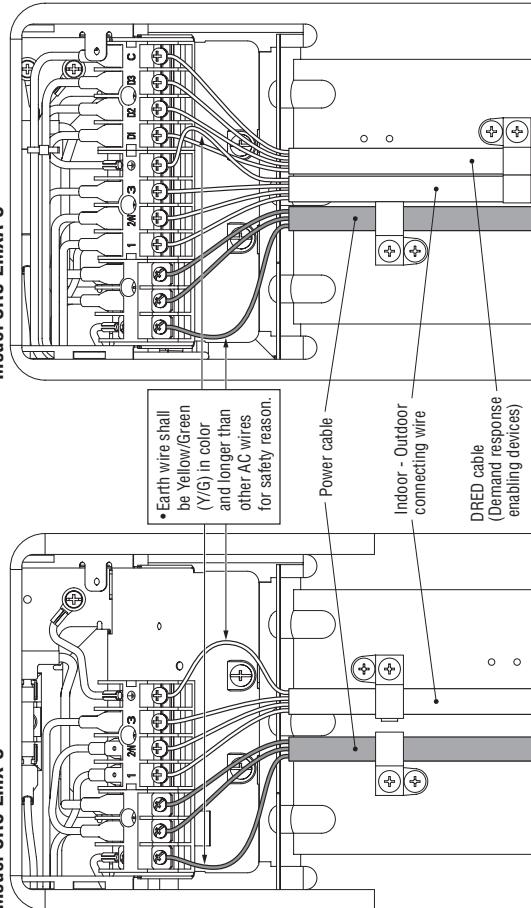

**CAUTION**

Use cables for interconnection wiring to avoid loosening of the wires. CENELEC code for cables Required field cables, H05RRN4G1.5 (Example) or 245IEC67

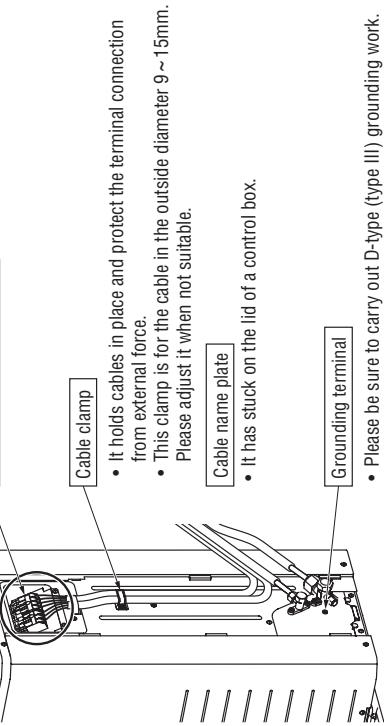

H	Harmonized cable type
05	300/500 volts
R	Natural-and/or synth. rubber wire insulation
R	Polychloroprene rubber conductors insulation
40r5	Stranded core
G	Number of conductors
1.5	One conductor of the cable is the earth conductor (yellow/green)
	Section of copper wire (mm <sup>2</sup> )

**Power cable, indoor - outdoor connecting wire circuit diagram**

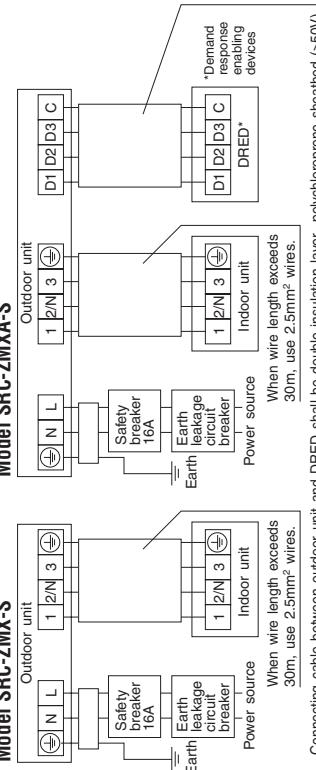

Model SRC-ZMX-S

Model SRC-ZMX-S

**Power cable, indoor-outdoor connecting wires**

Model SRC-ZMX-S

When wire length exceeds 30m, use 2.5mm<sup>2</sup> wires.

Connecting cable between outdoor unit and DRED shall be double insulation layer, polychloroprene sheathed (>50V) with size 4 x (0.5mm<sup>2</sup> to 2.0mm<sup>2</sup>) cable or flexible cord, where the maximum allowable length is 30m.

Always perform grounding system installation work with the power cord unplugged.

- Connect a pair bearing a common terminal number with an indoor-outdoor connecting wire.
- In cabling, fasten cables securely with cable clamps so that no external force may work on terminal connections.
- Grounding terminals are provided in the control box.

**CAUTION**  
Always use an earth leakage circuit breaker designed for inverter circuits to prevent a faulty operation.

Phase	Earth leakage breaker	Switchgear or Circuit Breaker	Power source (minimum)
Single-phase	15A, 30mA, 0.1sec or less	Switch breaker	Over current protector rated capacity
		30A	16A
		2.0mm <sup>2</sup>	1.5mm <sup>2</sup> X 4

The specifications shown in the above table are for units without heaters. For units with heaters, refer to the installation instructions or the construction instructions of the indoor unit.

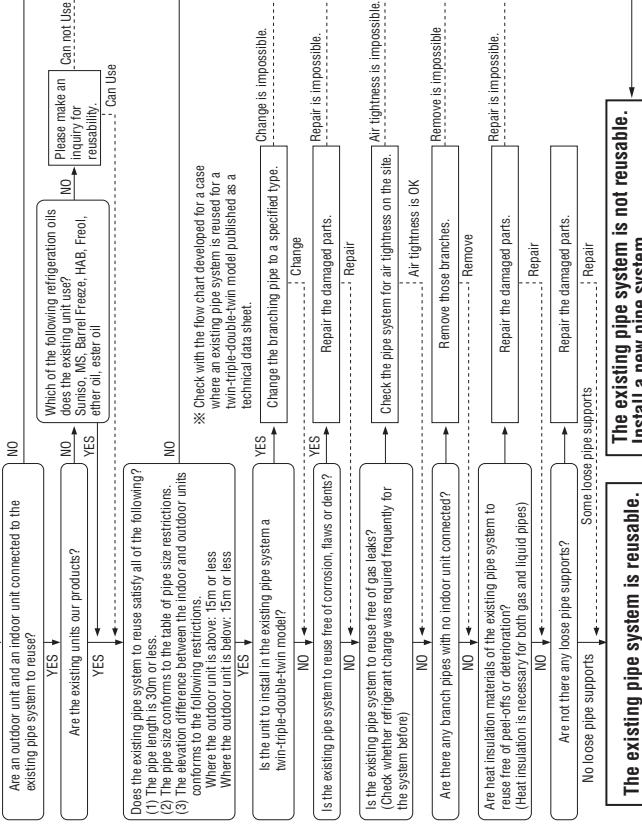

• Switchgear or Circuit breaker capacity which is calculated from MAX. over current should be chosen along the regulations in each country.

- The cable specifications are based on the assumption that a metal or plastic conduit is used with no more than three cables contained in a conduit and a voltage drop is 2%. For an installation falling outside of these conditions, please follow the internal cabling regulations. Adapt it to the regulation in effect in each country.

## 5. UTILIZATION OF EXISTING PIPING

Check whether an existing pipe system is reusable or not by using the following flow chart.

**START**

<Table of pipe size restrictions>

◎: Standard pipe size O: Usable Δ: Restricted to shorter pipe length limits

Pipe size	Additional charge volume per meter of pipe	0.029kg/m	0.06kg/m
Liquid pipe	06.35	09.52	
Gas pipe	012.7	012.7	
Usability	◎	△	
40	Maximum one-way pipe length	30	10
Length covered without additional charge	15	5	
50	Maximum one-way pipe length	30	10
Length covered without additional charge	15	15	
60	Maximum one-way pipe length	30	10
Length covered without additional charge	15	5	

Please consult with our distributor in the area.

• Please make an inquiry for refrigerant and charge it again.

• Any combinations of pipe sizes not listed in the table are not usable.

Formula to calculate additional charge volume

Additional charge volume (kg) =  

$$(\text{Main pipe length (m)} - \text{Length covered without additional charge shown in the table (m)}) \times \text{Additional charge volume per meter of pipe shown in the table (kg/m)}$$

**WARNING**

\* If you obtain a negative figure as a result of calculation, no additional refrigerant needs to be charged.

Example) When an 80 is installed in a 10m long existing pipe system (liquid 0.952, gas 0.27), the quantity of refrigerant to charge additionally should be  $(10m - 5m) \times 0.06kg/m = 0.3 kg$ .

<Where the existing unit can be run for a cooling operation.>

Carry out the following steps with the existing unit (in the order of (1), (2), (3) and (4))

- (1) Run the unit for 30 minutes for a cooling operation.
- (2) Stop the indoor fan and run the unit for 3 minutes for a cooling operation (returning liquid)
- (3) Close the liquid side service valve of the outdoor unit and pump down (refrigerant recovery)
- (4) Blow with nitrogen gas. \* If discolored refrigerant oil or any foreign matters is discharged by the blow, wash the pipe system or install a new pipe system.

• For the flare nut, do not use the old one, but use the one supplied with the outdoor unit.

Process a flare to the dimensions specified for R410A.

<Where the existing unit cannot be run for a cooling operation.>

Wash the pipe system or install a new pipe system.

• If you choose to wash the pipe system, please contact our distributor in the area.

## INSTALLATION TEST CHECK

### After Installation

#### POINTS

Check the following points again after completion of the installation, and before turning on the power. Conduct a test run again and ensure that the unit operates properly. Explain to the customer how to use the unit and how to take care of the unit following the instruction manual.

- Power cables and connecting wires are securely fixed to the terminal block.
- The pipe joints for indoor and outdoor pipes have been insulated.
- The reverse flow check cap is attached.
- The cover of the pipe cover (A) faces downward to prevent rain from entering.
- Gaps are properly sealed between the pipe covers (A) (B) and the wall surface / pipes.
- The screw of the side cover is tightened securely.
